

DESCRIPTION
CARBOSTYRIL COMPOUND

TECHNICAL FIELD

5 The present invention relates to a carbostyrl compound.

BACKGROUND OF THE INVENTION

 The trefoil factor family (TFF) is a group of highly
stable peptides, having a three-leaved clover-like structure
10 formed from six cysteine residues. Three TFF peptides (TFF1, TFF2
and TFF3) have been identified so far in humans. TFFs are present
in mucus-related tissues such as the alimentary tract, and are
secreted mainly by mucus-secreting cells. The expression of TFF
peptides is up-regulated in the vicinity of damaged mucosa and in
15 regenerating glands. It is reported that the main functions of
TFF peptides lie in the augmentation of cell migration processes
(motogenic effects), protection of cells, and suppression of
apoptosis [Nature Reviews, Molecular Cell Biology, Vol. 4: 721-
732(2003)].

20 TFF2 is a peptide of 106 amino acid residues, initially
isolated from porcine pancreas. The TFF2 peptide is abundant in
the gastric mucous neck cells, the pyloric region of the stomach,
the mucosa surrounding ulcers, the regenerative mucosa, the
overlying mucus layer, Brunner's glands, and so forth.

25 It has been confirmed with experiments using rats that
TFF2 prevents the development of colitis and gastric ulceration
and also accelerates the healing thereof [Gastroenterology 108:
108-116(1995); Gastroenterology 110: 489-497(1996); Alim.
Pharmacol. Ther., 14: 1033-1040(2000); Gut, 45: 516-522(1999);
30 Gut, 44: 636-642, 1999; and J. Leukoc. Biol., Vol. 75: 214-
223(2004)].

 Other experiments show that indomethacin-induced
gastric ulcers are exacerbated in TFF2 knockout mice [J. Clin.
Invest., Vol. 109: 193-204(2002)].

35 Eur. J. Clin. Invest., 32: 519-527(2002) discloses the

ability of TFF2 to stabilize mucus.

Am. J. Respir. Cell Mol. Biol., Vol. 29: 458-464(2003) teaches that TFF2 might be involved in regulating the proliferation of damaged airway epithelia.

5 It can be understood from the above that TFF2 plays key roles in protection against and repair of mucosal injury. With regard to diseases which are likely to be cured with TFF2, improved therapeutic effects are expected by a promotion of endogenous TFF2 production.

10 Gastroenterology, 126: 796-808(2004) discloses that TFF3 is effective for curing alimentary tract mucositis such as stomatitis induced by the administration of carcinostatics. Science, Vol. 274: 259-262(1996) and Gastroenterology, 119: 691-698(2000) conclude, from the fact that stomach cancer was
15 developed in TFF1 knockout mice, that the TFF1 gene may function as a tumor suppressor gene. Nature Reviews, Molecular Cell Biology, Vol. 4: 721-732(2003) and Int. J. Mol. Med., 12: 3-9(2003) suggest that TFF2 may act in a similar way as TFF1 and TFF3.

20 As compounds for up-regulating TFF2 expression, ligands for peroxisome proliferator-activated receptor- γ (PPAR γ) (e.g., indomethacin, aspirin, prostaglandin J₂ and troglitazone) are known [FEBS Lett., 488: 206-210(2001); Alim. Pharmacol. Ther., 18 (suppl. 1): 119-125(2003); FEBS Lett., 558: 33-38(2004); and Can.
25 Res., 61: 2424-2428(2001)].

Among various proteins, keratinocyte growth factor (KGF) is reported to enhance TFF2 and TFF3 expressions in rat lower gastrointestinal tracts [Am. J. Physiol. Regul. Integr. Comp. Physiol., 284: R564-R573(2003)].

30 Some studies teach pharmacological actions of the TFF peptides themselves, and suggest the possibility of their application in clinical medicine (WO92/14837, WO02/102403, and WO02/46226).

WO01/002377 and WO02/051419 disclose various compounds
35 having a substituent containing a 2,4-dioxo-thazolidinyl or 4-

oxo-2-thioxo-thiazolidinyl moiety on a heteroaryl skeleton such as a quinoline. These documents also disclose that such compounds exhibit telomerase inhibitory activity.

A wide variety of reaction conditions selected for an ordinary amide bond formation reaction are applicable to the reaction of Compound (1j) with Compound (11), such as, in particular, (a) a mixed acid anhydride process in which Carboxylic Acid (1j) is reacted with an alkyl halocarboxylate to

25

form a mixed acid anhydride and reacting this anhydride with Amine (11), (b) an activated ester process in which Carboxylic Acid (1j) is activated into an activated ester such as phenyl ester, *p*-nitrophenyl ester, *N*-hydroxysuccinimide ester, 1-hydroxybenzotriazole ester, etc., or into an activated amide with benzoxazoline-2-thione, and then reacted with Amine (11), (c) a carbodiimide process in which Carboxylic Acid (1j) and Amine (11) are subjected to a condensation reaction in the presence of an activating agent such as dicyclohexylcarbodiimide, 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide (WSC), carbonyldiimidazole, or the like, (d) other processes, for example, in which Carboxylic Acid (1j) is converted into a carboxylic anhydride using a dehydration agent such as acetic anhydride, and reacting this carboxylic anhydride with Amine (11); an ester of Carboxylic Acid (1j) formed with a lower alcohol is reacted with Amine (11) at a high temperature and high pressure; an acid halide of Carboxylic Acid (1j), i.e., a carboxylic acid halide, is reacted with Amine (11), and like processes.

A mixed acid anhydride for use in the mixed acid anhydride process described above can be obtained by an ordinary Schotten-Baumann reaction, and the reaction product is usually used for the reaction with Amine (11) to give the desired compound of Formula (1k) without isolation from the reaction mixture.

The above-described Schotten-Baumann reaction is usually carried out in the presence of a basic compound.

Such basic compounds include any conventional basic compounds for use in Schotten-Baumann reactions, for example, triethylamine, trimethylamine, pyridine, dimethylaniline, *N*-ethyldiisopropylamine, dimethylaminopyridine, *N*-methylmorpholine, DBN, DBU, DABCO, and like organic bases; and carbonates such as sodium carbonate, potassium carbonate, sodium hydrogencarbonate and potassium hydrogencarbonate, metal hydroxides such as sodium hydroxide, potassium hydroxide and calcium hydroxide, potassium

Reference Example 158

Synthesis of 5-(1,3-dioxolan-2-yl)-1-{4-[(N-methyl-N-phenylamino)methyl]benzyl}-3,4-dihydro-1H-quinolin-2-one

10 1-(4-Chloromethylbenzyl)-5-(1,3-dioxolan-2-yl)-3,4-dihydro-1H-quinolin-2-one (100 mg, 0.28 mmol), N-methylaniline (0.045 ml, 0.42 mmol) and potassium carbonate (57.9 mg, 0.42 mmol) were added to acetonitrile (1 ml),

15 followed by heating under reflux for 4 hours. After cooling to room temperature, water was added to the reaction mixture, and extraction with dichloromethane was performed. The organic layer was washed with water and a saturated sodium chloride solution, and dried over anhydrous sodium sulfate.

20 The dry product was concentrated under reduced pressure, and the residue was purified by preparative silica gel thin layer chromatography (n-hexane:ethyl acetate = 1:1). The purified product was concentrated to dryness under reduced pressure to thereby obtain 80 mg (yield: 67%) of 5-(1,3-dioxolan-2-yl)-1-

{4-[(N-methyl-N-phenylamino)methyl]benzyl}-3,4-dihydro-1H-quinolin-2-one as a light yellow amorphous solid.

Reference Example 159

Synthesis of 5-(1,3-dioxolan-2-yl)-1-(6-piperidinomethylpyridin-2-ylmethyl)-3,4-dihydro-1H-quinolin-2-one

1-(6-Chloromethylpyridin-2-ylmethyl)-5-(1,3-dioxolan-2-yl)-3,4-dihydro-1H-quinolin-2-one (1.0 g, 2.8 mmol) was added to piperidine (2 ml), followed by stirring in an argon atmosphere at 100°C for 2 hours. After cooling to room temperature, water and a small quantity of acetic acid were added to the reaction mixture, and extraction with ethyl acetate was performed twice. The organic layers were combined, washed twice with water and once with a saturated sodium chloride solution, and dried over anhydrous sodium sulfate. Example 1

Synthesis of 5-(8-methoxy-1-methyl-2-oxo-1,2-dihydroquinolin-5-ylmethyl)thiazolidine-2,4-dione

1.0 g of 2-chloro-3-(8-methoxy-1-methyl-2-oxo-1,2-dihydroquinolin-5-yl)propionic acid, 0.45 g of thiourea, and 0.4 g of sodium acetate were added to 20 ml of methoxy ethanol, and the mixture was stirred at 110°C for 7.5 hours. The reaction mixture was concentrated under reduced pressure, an aqueous sodium hydrogencarbonate solution was added to the residue to precipitate a solid, and the precipitated solid was collected by filtration. The filtrate was extracted with dichloromethane, and the extract was dried over anhydrous sodium sulfate and concentrated. The concentrated residue and the solid collected by filtration were combined and added to a mixed solvent of 10% hydrochloric acid and ethanol, followed by heating and refluxing overnight. The solvent was distilled off under reduced pressure, and the residue was recrystallized from an aqueous DMF, giving 0.41 g of 5-(8-methoxy-1-methyl-2-oxo-1,2-dihydroquinolin-5-ylmethyl)thiazolidine-2,4-dione as a yellow powder. Melting point: 254°C-255°C

Example 2

Synthesis of 5-[2-(8-methoxy-1-methyl-2-oxo-1,2-dihydroquinolin-5-yl)ethyl]thiazolidine-2,4-dione

912 mg of 2-chloro-4-(8-methoxy-1-methyl-2-oxo-1,2-dihydroquinolin-5-yl)butyric acid, 390 mg of thiourea, and 394 mg of sodium acetate were added to 20 ml of methoxyethanol, followed by stirring at 110°C for 4 hours. The reaction mixture was concentrated under reduced pressure. Water was added to the residue, and the mixture was extracted with dichloromethane. The extract was dried over anhydrous sodium sulfate and concentrated. The residue was added to a mixed solvent of 10 ml of 10% hydrochloric acid and 10 ml of ethanol, followed by heating and refluxing overnight. The

solvent was distilled off under reduced pressure, and the residue was recrystallized from a DMF-ethanol mixed solvent, giving 332 mg (31% yield) of 5-[2-(8-methoxy-1-methyl-2-oxo-1,2-dihydroquinolin-5-yl)ethyl]thiazolidine-2,4-dione as a yellow powder.

Melting point: 222°C to 224°C

Example 3

Synthesis of 5-[3-(8-methoxy-1-methyl-2-oxo-1,2-dihydroquinolin-5-yl)propyl]thiazolidine-2,4-dione

1 g of 2-chloro-5-(8-methoxy-1-methyl-2-oxo-1,2-dihydroquinolin-5-yl)valeric acid, 380 mg of thiourea, and 380 mg of sodium acetate were added to 20 ml of methoxyethanol, followed by stirring at 110°C for 5 hours. The reaction mixture was concentrated under reduced pressure, and water and a small amount of ethanol were added to the residue to precipitate a solid. The precipitated solid was collected by filtration. The solid collected by filtration was added to a mixed solvent of 10 ml of 10% hydrochloric acid and 10 ml of ethanol, followed by heating and refluxing overnight. The solvent was distilled off under reduced pressure, and the residue was extracted with dichloromethane. The extract was dried over anhydrous sodium sulfate and concentrated. The concentrated residue was purified by silica gel column chromatography (dichloromethane:methanol of 100:1 → 10:1), and recrystallized from an ethanol-ether mixed solvent, giving 332 mg (29% yield) of 5-[3-(8-methoxy-1-methyl-2-oxo-1,2-dihydroquinolin-5-yl)propyl]thiazolidine-2,4-dione as a light yellow powder. Melting point: 172°C to 175°C

Example 4

3.02 g of ethyl chloro-(8-methoxy-1-methyl-2-oxo-

1,2-dihydroquinolin-5-yl)acetate, 1.4 g of thiourea, and 2 g of sodium acetate were added to 50 ml of methoxyethanol, followed by stirring at 110°C for 2.5 hours. The reaction mixture was concentrated under reduced pressure. Water was added to the residue to precipitate a solid, and the precipitated solid was collected by filtration. The collected solid was added to a mixed solvent of 30 ml of 10% hydrochloric acid and 30 ml of ethanol, followed by heating and refluxing overnight. The resultant was concentrated to half its original volume under reduced pressure. Water was added thereto, and the mixture was cooled with ice to precipitate a solid. The precipitated solid was collected by filtration. The solid was recrystallized from a DMF-ethanol mixed solvent, giving 1.68 g (57% yield) of 5-(8-methoxy-1-methyl-2-oxo-1,2-dihydroquinolin-5-yl)thiazolidine-2,4-dione as a gray powder.

Example 1315

Synthesis of 8-methoxy-1-(3-methylbutyl)-5-(4-oxo-2-thioxothiazolidin-5-ylmethyl)-3,4-dihydro-1H-quinolin-2-one

3.0 g of 8-methoxy-1-(3-methylbutyl)-4-ylmethyl-2-oxo-
5 1,2,3,4-tetrahydroquinoline-5-carboxaldehyde and 1.53 g of 2-thioxo-1,3-thiazolidin-4-one were suspended in 30 ml of toluene. Five drops of piperidine and five drops of acetic acid were added, followed by heating and refluxing for overnight. After allowing to cool, the solid thus
10 precipitated was collected by filtration, and dried, and then suspended in 16 ml of toluene. 2.29 g of diethyl 1,4-dihydro-2,6-dimethyl-3,5-pyridine dicarboxylate and 4.0 g of silica gel were added to the suspension, followed by heating and refluxing overnight. The solvent was distilled off from
15 the reaction mixture, and the residue was purified by silica gel column chromatography (n-hexane:ethyl acetate=3:1 → 1:1). The purified product was recrystallized from an ethyl acetate-n-hexane mixed solvent, giving 2.11 g (55.2% yield) of 8-methoxy-1-(3-methylbutyl)-5-(4-oxo-2-thioxothiazolidin-
20 5-ylmethyl)-3,4-dihydro-1H-quinolin-2-one as a yellow powder. Melting point: 139.5°C to 141°C

Example 1316

Synthesis of 5-[1-(3-hydroxypropyl)-2-oxo-1,2,3,4-tetrahydroquinolin-5-ylmethyl]-3-tritylthiazolidine-2,4-dione
25

A DMF solution (10 ml) of 1.0 g (2.99 mmol) of 5-[1-(3-hydroxypropyl)-2-oxo-1,2,3,4-tetrahydroquinolin-5-ylmethyl]thiazolidine-2,4-dione and 0.455 g (3.29 mmol) of potassium carbonate was cooled with ice, and 0.876 g (3.04
30 mmol) of triphenylmethylchloride was added thereto, followed by stirring at room temperature overnight. Water was added to the reaction liquid and the mixture was extracted with ethyl acetate. The organic layer was washed twice with water and once with saturated sodium chloride solution, and
35 concentrated under reduced pressure. The residue was

purified by silica gel column chromatography (n-hexane:ethyl acetate=2:1 → ethyl acetate). The purified product was concentrated under reduced pressure and evaporated to dryness, giving 700 mg (40.6% yield) of 5-[1-(3-hydroxypropyl)-2-oxo-1,2,3,4-tetrahydroquinolin-5-ylmethyl]-3-tritylthiazolidine-2,4-dione as a colorless amorphous solid.

Example 1317

Synthesis of 5-{1-[3-(4-methylphenoxy)propyl]-2-oxo-1,2,3,4-tetrahydroquinolin-5-ylmethyl}thiazolidine-2,4-dione

A THF solution (2 ml) of 100 mg (0.18 mmol) of 5-[1-(3-hydroxypropyl)-2-oxo-1,2,3,4-tetrahydroquinolin-5-ylmethyl]-3-trityl thiazolidine-2,4-dione, 0.0363 ml (0.347 mmol) of p-cresol, and 91.1 mg (0.35 mmol) of triphenylphosphine was cooled with ice. 0.158 ml of azodicarboxylic acid diethyl (2.2 M toluene solution) was added to the solution in an argon atmosphere. The mixture was stirred at room temperature for two hours, and ethyl acetate was added to the reaction liquid. After washing with water, the organic layer was concentrated under reduced pressure, and the residue was purified by preparative silica gel thin layer chromatography (n-hexane:ethyl acetate=1:1). The purified product was concentrated under reduced pressure, and 2 ml of a solution of 4N-hydrogen chloride/ethyl acetate was added to the residue. The mixture was stirred at room temperature overnight, and further stirred at 70°C for 1.5 hours. The mixture was concentrated under reduced pressure, and the residue was purified by preparative silica gel thin layer chromatography (n-hexane:ethyl acetate=1:1). The purified product was concentrated under reduced pressure and evaporated to dryness, giving 27.1 mg (34.4% yield) of 5-{1-[3-(4-methylphenoxy)propyl]-2-oxo-1,2,3,4-tetrahydroquinolin-5-ylmethyl}thiazolidine-2,4-dione as a colorless amorphous solid.

Preparation Example 2

1-(2-Phenylethyl)-8-methoxy-5-(4-oxo-2-thioxo-5-thiazolidinyl)methyl-3,4-dihydro-1H-quinolin-2-one 5 g

20 Polyethyleneglycol (molecular weight: 4000) 0.3 g

Sodium chloride 0.9 g

Polyoxyethylenesorbitan monooleate 0.4 g

Sodium metabisulfite 0.1 g

Methyl-paraben 0.18 g

25 Propyl-paraben 0.02 g

Distilled water for injection 100 ml

The above parabens, sodium metabisulfite and sodium chloride are dissolved into distilled water at 80°C with agitation. The obtained solution is cooled to 40°C, and the compound of the invention, polyethyleneglycol and polyoxyethylenesorbitan monooleate are dissolved into the

above solution. Further distilled water for injection is then added to the solution to adjust the solution to the final amount. The resultant solution is subjected to filter sterilization using an appropriate filter paper, and 1 ml of the filtered solution is dispensed into ampules to prepare injectable solutions.

Test Example 1

Transcription promoting activity on human Trefoil Factor 2 (hTFF2) gene of test compounds was evaluated by means of an hTFF2 gene reporter assay.

(1) Preparation of hTFF2 gene reporter vector pGL3-hTFF2pro

DNA was extracted from HeLa cells (CCL-2, DAINIPPON PHARMACEUTICAL CO., LTD.) using a deoxyribonucleic acid (DNA) extraction kit (DNeasy™ Tissue Kit, manufactured by QIAGEN). The hTFF2 promoter region was amplified using the extracted DNA as a template by means of the polymerase chain reaction (PCR). The oligomers 5'-CACGCGTCAGACTGGCAACCCCTGTC-3' and 5'-GAAGCTTCTAGCTCAGCTGCACCCAG-3' were selected as PCR primers to be amplified, based on the report by Beck et al. (Beck S., Sommer P., Blin N., Gott P., 5'-flanking motifs control cell-specific expression of trefoil factor genes (TFF), Int. J. Mol. Med. 2(3), 353-361 (1998)). Platinum® Pfx DNA polymerase was used as DNA polymerase. The PCR was performed under the conditions of denaturing for 30 seconds at 95°C, annealing for 30 seconds at 55°C and extending for 75 seconds at 68°C, and the procedures were repeated for 32 cycles.

The PCR products were separated and purified by 1 % agarose gel electrophoresis, and cloned to a pCR-BluntII-TOPO vector attached to a cloning kit (Zero Blunt® TOPO® PCR Cloning Kit, manufactured by Invitrogen Corporation). The produced plasmid pCR-Blunt-TFF2pro was introduced into *E.coli* for transformation (TOP 10 Ultracomp™ Cells, manufactured by Invitrogen Corporation), and transformant strain pCR-Blunt-TFF2pro/TOP10 was selectively cultured in LB agar medium containing 30µg/ml of Zeocin (Zeocin, manufactured by Invitrogen Corporation). The pCR-Blunt-TFF2pro/TOP10 was subjected to shaking culture in 50 ml of LB medium containing 30µg/ml of Zeocin at 37°C over night, and a plasmid was prepared using a plasmid preparation kit (Concert™ High Purity Midiprep System, manufactured by GIBCO BRL).

15

The nucleotide sequence of the PCR product cloned to the plasmid pCR-Blunt-TFF2pro was determined. The determined nucleotide sequence was compared with the counterpart of hTFF2 promoter region reported in a gene bank (GenBank accession AB038162). The nucleotide sequence of the MluI-HindIII region cloned in pCR-Blunt-TFF2pro was identical to GenBank accession AB038162 (Fig. 1).

Fig. 1 shows in the upper register the nucleotide sequence and nucleotide numbering of the hTFF2 promoter region reported in GenBank (accession AB038162). The lower register shows the nucleotide sequence (see appended Sequence Number 1 shown in Sequence Listing) of the PCR product cloned in the plasmid pCR-Blunt-TFF2pro. The underlined portions indicate the recognition sequence (ACGCGT) of the restriction enzyme MluI and the recognition sequence (AAGCTT) of the

30

restriction enzyme HindIII. The nucleotide sequences of the MluI-HindIII region are identical between the hTFF2 promoter region reported in GenBank and the PCR product cloned to the plasmid pCR-Blunt-TFF2pro. ATG enclosed in the box is the
5 translation start codon and the arrow shows the transcription initiation site.

The plasmid pCR-Blunt-hTFF2pro was cleaved by the restriction enzymes MluI and HindIII, fractionated by 1%
10 agarose gel electrophoresis, and the hTFF2 promoter region was purified using a nucleic acid purification kit (Concert™ Matrix Gel Extraction System, manufactured by GIBCO BRL). The hTFF2 promoter region was inserted into the MluI-HindIII region of a commercial plasmid pGL-Basic (manufactured by
15 Promega Corporation) using a ligation kit (Ligation high, manufactured by TOYOBO CO., LTD.) to produce pGL3-hTFF2pro. The plasmid pGL3-hTFF2pro was introduced into *E. coli* for transformation (DH5α Competent Cell, manufactured by TOYOBO CO., LTD.) and transformant strain pGL3-hTFF2pro/DH5α was
20 selectively cultured in LB agar medium containing 100μg/ml of ampicillin.

The pGL3-hTFF2pro/DH5α was inoculated into a 2-liter Erlenmeyer flask containing 400ml of LB medium containing
25 100μg/ml ampicillin, and subjected to 200 rpm shaking culture at 37°C in a rotary shaker overnight. The plasmid pGL3-hTFF2pro was extracted and purified from the cultured cells using a plasmid preparation kit (EndoFree Plasmid Maxi Kit, manufactured by QIAGEN).

30

A commercial vector, pWLneo (manufactured by

Stratagene), containing a drug-selection marker was introduced into *E. coli* for transformation (DH5 α Competent Cell, manufactured by TOYOBO CO., LTD.) and transformant strain pWLneo/DH5 α was selectively cultured in LB agar medium containing 100 μ g/ml of ampicillin. The pWLneo/DH5 α was inoculated into a 1-liter Erlenmeyer flask containing 150ml of LB medium containing 100 μ g/ml of ampicillin, and subjected to 200 rpm shaking culture at 37°C in a rotary shaker overnight. The plasmid pWLneo was extracted and purified from the cultured cells using a plasmid preparation kit (EndoFree Plasmid Maxi Kit, manufactured by QIAGEN).

(2)Preparation of cell line pGL3-hTFF2pro·pWL-neo/MKN-45 #6-2 for hTFF2 gene reporter assay

Human gastric cancer cell line MKN-45 (JCRB0254, Health Science Research Resources Bank) was cultured in medium (IMDM medium) composed of 500 ml of medium (Iscove's Modified Dulbecco's Medium, manufactured by SIGMA), 50 ml of fetal bovine serum (manufactured by SIGMA) immobilized by heating at 56°C for 30 minutes, 5 ml of Penicillin-Streptomycin liquid (manufactured by SIGMA) and 20 ml of 200 mM L-glutamin (manufactured by SIGMA), using a culture dish having a diameter of 10 cm (CORNING Incorporated) placed in a 5% CO₂ incubator at 37°C. The cells were washed with buffer (Dulbecco's Phosphate Buffered Saline, manufactured by SIGMA) and subjected to trypsin (0.25% Tripsin-1mM EDTA·4Na, manufactured by SIGMA) treatment for suspension. The cells were suspended in the IMDM medium, stained using Trypan Blue Stain, 0.4% (tradename, Invitrogen Corporation) and the number of cells which did not stain was counted as live cells using a hemocytometer. The cells were washed once with

buffer (Dulbecco's Phosphate Buffered Saline, manufactured by SIGMA) and 10^6 live cells were suspended in a solution for gene transfer (0.25 M Mannitol/0.1 mM CaCl_2 /0.1 mM MgCl_2 /0.2 mM Tris-HCl, pH7.2 to 7.4) to which 10 μg of the prepared
5 plasmid pGL3-hTFF2pro and 2 μg of the plasmid pWLneo were added. The plasmid-added cell suspension was transferred to a 1mm cuvette (manufactured by Bio-Rad Laboratories, Inc.) and gene introduction into cells was performed by means of electroporation using an SSH-1 cell fusion apparatus
10 (Shimadzu Corporation). The cells were suspended in the IMDM medium, inoculated in a culture dish having a diameter of 10 cm (CORNING Incorporated) and cultured in a 5% CO_2 incubator at 37°C for 2 days. Selective culturing was then carried out using IMDM medium containing 400 $\mu\text{g}/\text{ml}$ of Geneticin
15 (manufactured by Invitrogen Corporation). 100 μl of the culture medium was then first inoculated into each well of a 96-well plate (manufactured by BD Falcon), and proliferated cells were sequentially subjected to passaged culturing in a 24-well plate (manufactured by BD Falcon) and further in a 6-
20 well plate (manufactured by BD Falcon) to prepare pGL3-hTFF2pro·pWL-neo/MKN-45 #6 cells. The obtained pGL3-hTFF2pro·pWL-neo/MKN-45 #6 cells were suspended in IMDM medium containing 400 $\mu\text{g}/\text{ml}$ of Geneticin, inoculated into a 96-well plate by means of limiting dilution for cloning to
25 obtain single clone pGL3-hTFF2pro·pWL-neo/MKN-45 #6-2 cells. The pGL3-hTFF2prod·pWL-neo/MKN-45 #6-2 cells were proliferated in a 10 cm culture dish, harvested and cryopreserved.

30 (3) The hTFF2 genetic reporter assay using pGL3-hTFF2pro·pWL-neo/MKN-45 #6-2 cell line

pGL3-hTFF2pro · pWL-neo/MKN-45 #6-2 was thawed from the frozen state for use. The cells were inoculated into IMDM medium containing 400 µg/ml of Geneticin in a 10 cm culture dish and sequentially passaged every 3 to 5 days. During the
5 passage culturing, the cells were washed with buffer (Dulbecco's Phosphate Buffered Saline, manufactured by SIGMA), and trypsin (0.25% Trypsin-1mM EDTA·4Na, manufactured by SIGMA) was added to separate the cells by treatment for 5 minutes at 37°C. The cell suspension was collected by adding
10 IMDM medium, and the cells were stained using Trypan Blue Stain, 0.4% (tradename, Invitrogen Corporation) and the number of cells which did not stain was counted as live cells using a hemocytometer. A cell survival rate of 90 % or higher was confirmed prior to the live cells being used for
15 the hTFF2 genetic reporter assay.

A day before test compounds were added, 100 µl of the cell suspension containing about 7.5×10^4 cells was inoculated into each well of 96-well plates (manufactured by
20 COSTAR) and cultured in a 5 % CO₂ incubator at 37 °C. The test compounds were prepared to have a concentration 200 times the final measurement concentration with dimethylsulfoxide (Wako Pure Chemical Industries, Ltd.). The test compounds having a predetermined concentration were
25 respectively diluted 100 times with IMDM medium, and 100 µl of the diluted compounds was dispensed into wells of the 96-well plates. Dimethylsulfoxide was diluted 100 times with IMDM medium and added to those wells to which test compounds were not added. After the test compounds were added, the
30 cells were cultured in a 5 % CO₂ incubator at 37 °C for 24 hours. When the culturing was completed, the culture

supernatant was removed and the 96-well plates were frozen in a deep freezer (manufactured by SANYO Electric Co., Ltd.). The 96-well plates were thawed at room temperature when the luciferase activity was measured, and 100 μ l of PicaGene
5 LT2.0 (Wako Pure Chemical Industries, Ltd.) diluted two times with buffer (Dulbecco's Phosphate Buffered Saline, manufactured by SIGMA) was added to each well. The plates were allowed to stand at room temperature for at least 30 minutes and the luciferase activity was measured using a
10 Labsystems Luminoskan (manufactured by ICN Biomedicals Inc.).

Taking the average measurement of the dimethylsulfoxide-added well groups in each plate as 100%, a percentage for each test compound to the demethylsulfoxide-
15 added well groups (control %) was calculated.

The results are shown in the table below.

Test Example 2

Healing effects on rat models with acetic acid-induced gastric ulcers

(1) Production of gastric ulcer by acetic acid

Rats were fasted from the previous day. A celiotomy was done in each rat under ether anesthesia, and the stomach was exteriorized. Subsequently, 20 μ L of a 30 % acetic acid solution was injected into the submucosa at the junction of the body of the glandular stomach and the

pyloric antrum using a disposable syringe to produce a gastric ulcer.

(2) Test compound administration

5 Each test compound was suspended in a 0.5% carboxymethylcellulose (CMC) solution at concentrations of 0.75 or 2.5 mg/ml. The rats were orally administered once a day for 8 days starting with the forth day from operation at doses of 3 or 10 mg/kg. A gastric tube and a syringe were
10 used for the oral administration. The volumes of each test compound and vehicle (0.5% CMC) were 4 ml/kg.

(3) Dissection

 On the next day the vehicle and the test compound were
15 finally administered to the rats, the rats were sacrificed by exsanguination under anesthesia with ether, and each stomach was removed. The removed stomachs were fixed in 1 % formalin for 15 minutes, dissected along the greater curvature of stomach to expose the ulcer, and the ulcerated
20 area was measured.

(4) Measurement of the ulcerated area

 The ulcerated area was measured under a stereo microscope (10 x) with an ocular micrometer (1 mm²/grid), and
25 the percentage healing ratio was calculated. The test results were shown in the Table 184. The percentage healing ratio was calculated by the following formula.

30
$$\text{Healing ratio (\%)} = \frac{\text{average ulcerated area of control group} - \text{average ulcerated area of test compound group}}{\text{average ulcerated area of control group}} \times 100$$
